

America HQ - San Clemente, California  
Asia HQ - Beijing, China

AmerAsia global Leadership has worked with Big Law for 30+ years, and in Asia for 12 years. We know that getting safe, secure, successful technology results in China and America requires identifying the best supplier/partners available to you. But, alas....

January 14, 2019: The [2018 Legal Technology Survey Report](#) revealed 95% of Law Firm lawyers are concerned about your companies data security and privacy yet, barely one third of those same lawyer/law firms implement, on average, any one of the 13 standard precautionary security measures listed in the 2018 Survey. And, only about 15% used a Security Operations Center of any type. This is in America.

In China, at AmerAsia Beijing, in a typical 24 hour period, our front end Beijing AWS security servers protecting our clients critical documents/information/trade secrets get hit no less than 3 million times daily by suspicious internet traffic. 100,000 of these visitors, daily, attempt to hack our SSH encrypted servers using brute force SSH hacking methods (a data packet showing up at our encrypted Beijing IP address with a payload holding 1,000,000's of passwords and encryption codes attempting to "hack away" on our IP port until they break in to our servers and your data). The other 2.9M hits over the past 24 hours are looking for SSH server port authentications identifying vulnerable ports for hacking.

Here is where these 100,000 hack attempts came from the past 24 hours, using a partial look at our Security Operations Center (SOC) dashboard and our IPGEO CrossCheck tool:

*Does your supplier know this information?*

*Can they show you this information?*

*If not, how can they detect, let alone stop, your competitors/maligners probing your 3rd party document servers and your trade secrets in China and Asia?*
